

# Astrostatistics (L24)

Kaisey Mandel

This course will cover statistical methods necessary to properly interpret today's increasingly complex datasets in astronomy. Particular emphasis will be placed on principled statistical modeling of astrophysical data and statistical computation of inferences of scientific interest. Statistical problems and techniques, such as Bayesian modeling, nonparametric methods, density estimation, regression, classification, time series analysis, sampling methods, and machine learning, will be examined in the context of applications to modern astronomical data analysis. Topics and examples will be motivated by case studies across astrophysics and cosmology.

## Pre-requisites

Students of astrophysics, physics, statistics or mathematics are welcome. Astronomical context will be provided when necessary. Students without a previous statistics background should familiarise themselves with the material in Feigelson & Babu, Chapters 1-4, and Ivezić, Chapters 1, 3-5, by the beginning of the course. (Note that the two textbooks cover many of the same topics). These texts are freely available online to Cambridge students via the library website.

## Literature

1. E. Feigelson and G. Babu. *Modern statistical methods for astronomy: with R applications*. Cambridge University Press, 2012.
2. Z. Ivezić, A. Connolly, J. VanderPlas & A Gray. *Statistics, Data Mining, and Machine Learning in Astronomy*. Princeton University Press, 2014.
3. C. Schafer. *A Framework for Statistical Inference in Astrophysics*. 2015, Annual Review of Statistics and Its Application, 2: 141-162

## Additional support

Four examples sheets will be provided and four associated examples classes will be given. There will be a one-hour revision class in the Easter Term.
